### **Oqilov Akmaljon Ahmadovich thesis on the topic "Efficiency of the use of production factors in the regions of the regional economy (on the example of the Sughd region of the Republic of Tajikistan)"**

The thesis of Oqilov Akmaljon Ahmadovich is devoted to the urgent problem of the development of the regions of the Republic of Tajikistan. The author studied the nature of the factors of production, examined the systemic nature of the interaction of factors of production, investigated the concept of the effectiveness of the use of factors of production, analyzed the use of production factors (labor, land, capital and entrepreneurial ability) in the development of Sughd region's economy, determined the impact of institutional elements on improving personal factors production, revealed an acceptable type of modernization of the regional economy, The effective use of factors of production, the relationship between the growth of production efficiency and the rational use of factors of production.

One of the main features of the dissertation research is the provision according to which the author proves that the conceptual basis of the effectiveness of the use of production factors lies in their interaction and complementarity. The main theoretical approaches to determining the effective use of factors of production are systematized, within the framework of which it is proved that the latter is an economic activity in which the return from the factors of production used moves towards maximizing profit. Therefore, when determining the effectiveness of the use of factors of production, one should operate with a whole set of criteria and indicators that reflect the effectiveness of each factor, individually and collectively, within the framework of the production function used. The most valuable in this study is the verbal model of the relationship between the growth of production efficiency and the rational use of production factors in the regional economy proposed by the author, which provides for a set of measures to achieve intermediate (increasing labor productivity, reducing the material consumption of production, increasing the return on assets and eliminating downtime of production equipment) and final competitiveness of products, increase sales and increase profitability from the use of production factors through a synergistic effect.

These provisions give reason to believe that this thesis has elements of scientific novelty and represents a complete study on an actual topic.
